

Customer Experience: Veterinary clinic

SITE:

Veterinary clinic SoVet
Espoo

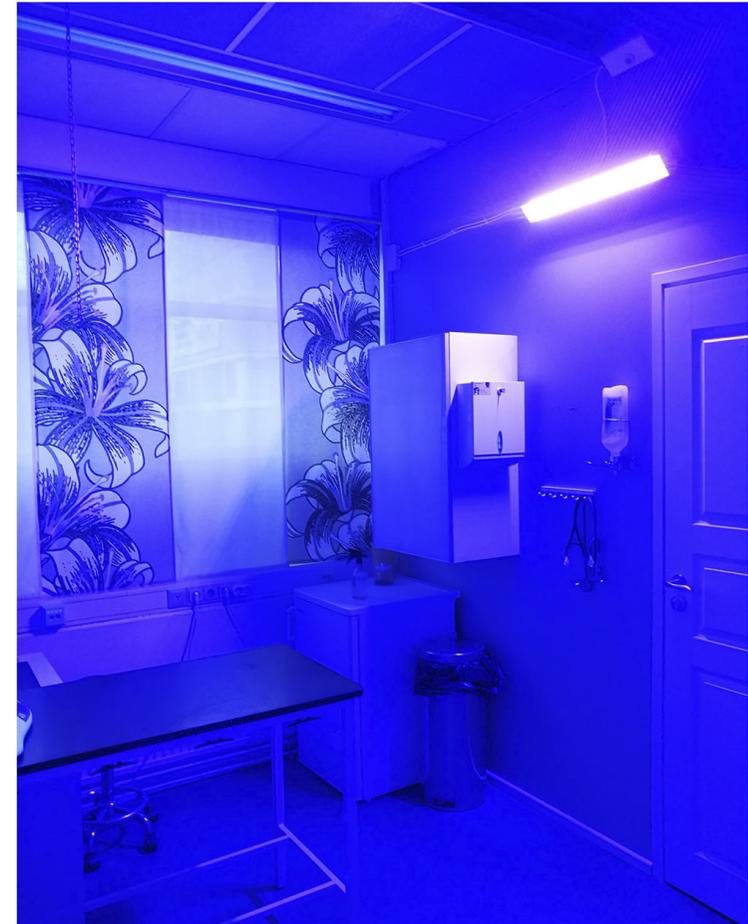

PROBLEM:

Veterinary clinic SoVet offers comprehensive veterinary services, from basic procedures to highly specialised operations. Most of the patients are felines and canines. As SoVet treats many rescue dogs, they are concerned about the growing prevalence of multidrug-resistant bacteria.

SOLUTION:

LED Tailor's photon disinfection system was installed in the room where infections are treated. Fluorescent tubes were replaced with white ANTiBAC AiRTUBEs, which serve as work lights. Disinfection is done with a WiSDOM AiR photon disinfection luminaire, which switches on automatically when the room is unoccupied. Catalytic coating was also applied to surfaces in the room to boost disinfection.

BENEFITS:

"We decided to install the system to provide a higher degree of assurance, especially for disinfection carried out after treating patients carrying multi-resistant bacteria. As a non-hazardous system, photon disinfection seemed the ideal solution for us, as it provides the same high level of completely automatic disinfection every day. Installation of the system was done without disruption to our routine. Next we intend to have the same system installed in our operating theatre."

- Maarit Luukkainen, veterinarian
